2.10 原根相关

1. 模 m 有原根的充要条件：$m = 2, 4, p^a, 2p^a$，其中 p 是奇素数；
2. 求任意数 p 原根的方法：对 $\phi(p)$ 因式分解，即 $\phi(p) = p_1^{r_1} p_2^{r_2} \cdots p_k^{r_k}$，若恒成立：

$$g^{\frac{p-1}{g}} \neq 1 \pmod{p}$$

   那么 g 就是 p 的原根。

3. 若模 m 有原根，那么它一共有 $\Phi(\Phi(m))$ 个原根。

技巧

8.1 真正的释放 STL 容器内存空间

```cpp
template <typename T>
__inline void clear(T& container) {
    container.clear();  // 或者删除了一堆元素
    T(container).swap(container);
}
```

8.2 无敌的大整数相乘取模

Time complexity $O(1)$.

```cpp
// 需要保证 x 和 y 非负
long long mult(long long x, long long y, long long MODN) {
    long long t = (x * y - (long long)((long double)x / MODN * y + 1e-3) * MODN) % MODN;
    return t < 0 ? t + MODN : t;
}
```

8.3 无敌的读入优化

```cpp
// getchar() 读入优化 << 关同步 cin << 此优化
// 用 isdigit() 会小幅变慢
// 返回 false 表示读到文件尾
namespace Reader {
    const int L = (1 << 15) + 5;
    char buffer[L], *S, *T;
    __inline bool getchar(char &ch) {
        if (S == T) {
            T = (S = buffer) + fread(buffer, 1, L, stdin);
            if (S == T) {
                ch = EOF;
                return false;
            }
```

```
        }
        ch = *S++;
        return true;
    }
    __inline bool getint(int &x) {
        char ch; bool neg = 0;
        for (; getchar(ch) && (ch < '0' || ch > '9'); ) neg ^= ch == '-';
        if (ch == EOF) return false;
        x = ch - '0';
        for (; getchar(ch), ch >= '0' && ch <= '9'; )
            x = x * 10 + ch - '0';
        if (neg) x = -x;
        return true;
    }
}
```

Chapter 9

提示

9.1 控制 cout 输出实数精度

```
std::cout << std::fixed << std::setprecision(5);
```

9.2 vimrc

```
set nu
set sw=4
set sts=4
set ts=4
syntax on
set cindent
```

9.3 让 make 支持 c++11

In .bashrc or whatever:

```
export CXXFLAGS='-std=c++11 -Wall'
```

9.4 tuple 相关

```
mytuple = std::make_tuple (10, 2.6, 'a');           // packing values into tuple
std::tie (myint, std::ignore, mychar) = mytuple;    // unpacking tuple into variables
std::get<I>(mytuple) = 20;
std::cout << std::get<I>(mytuple) << std::endl;     // get the Ith(const) element
```

9.5 线性规划转对偶

$$\begin{array}{l}\text{maximize } \mathbf{c}^T\mathbf{x} \\ \text{subject to } \mathbf{A}\mathbf{x} \le \mathbf{b}, \mathbf{x} \ge 0\end{array} \iff \begin{array}{l}\text{minimize } \mathbf{y}^T\mathbf{b} \\ \text{subject to } \mathbf{y}^T\mathbf{A} \ge \mathbf{c}^T, \mathbf{y} \ge 0\end{array}$$

9.8 Java Hints

```
import java.io.*;
import java.lang.*;
import java.math.*;
import java.util.*;

/*    Regular usage:
        Slower IO :
            Scanner in = new Scanner (System.in);
            Scanner in = new Scanner (new BufferedInputStream (System.in));
            Input :
                in.nextInt () / in.nextBigInteger () / in.nextBigDecimal () / in.nextDouble ()
                in.nextLine () / in.hasNext ()
            Output :
                System.out.print (...);
                System.out.println (...);
                System.out.printf (...);
        Faster IO :
            Shown below.
        BigInteger :
            BigInteger.valueOf (int) : convert to BigInteger.
            abs / negate () / max / min / add / subtract / multiply /
                divide / remainder (BigInteger) : BigInteger algebraic.
            gcd (BigInteger) / modInverse (BigInteger mod) /
                modPow (BigInteger ex, BigInteger mod) / pow (int ex) : Number Theory.
            not () / and / or / xor (BigInteger) / shiftLeft / shiftRight (int) : Bit operation.
```

```
            compareTo (BigInteger) : comparation.
            intValue () / longValue () / toString (int radix) : converts to other types.
            isProbablePrime (int certainty) / nextProbablePrime () : checks primitive.
        BigDecimal :
            consists of a BigInteger value and a scale.
            The scale is the number of digits to the right of the decimal point.
            divide (BigDecimal) : exact divide.
            divide (BigDecimal, int scale, RoundingMode roundingMode) :
                divide with roundingMode, which may be:
                    CEILING / DOWN / FLOOR / HALF_DOWN / HALF_EVEN / HALF_UP / UNNECESSARY / UP.
            BigDecimal setScale (int newScale, RoundingMode roundingMode) :
                returns a BigDecimal with newScale.
            doubleValue () / toPlainString () : converts to other types.
        Arrays :
            Arrays.sort (T [] a);
            Arrays.sort (T [] a, int fromIndex, int toIndex);
            Arrays.sort (T [] a, int fromIndex, int toIndex, Comperator <? super T> comperator);
        LinkedList <E> :
            addFirst / addLast (E) / getFirst / getLast / removeFirst / removeLast () :
                deque implementation.
            clear () / add (int, E) / remove (int) : clear, add & remove.
            size () / contains / removeFirstOccurrence / removeLastOccurrence (E) :
                deque methods.
            ListIterator <E> listIterator (int index) : returns an iterator :
                E next / previous () : accesses and iterates.
                hasNext / hasPrevious () : checks availablity.
                nextIndex / previousIndex () : returns the index of a subsequent call.
                add / set (E) / remove () : changes element.
        PriorityQueue <E> (int initcap, Comparator <? super E> comparator) :
            add (E) / clear () / iterator () / peek () / poll () / size () :
                priority queue implementations.
        TreeMap <K, V> (Comparator <? super K> comparator) :
            Map.Entry <K, V> ceilingEntry / floorEntry / higherEntry / lowerEntry (K):
                getKey / getValue () / setValue (V) : entries.
            clear () / put (K, V) / get (K) / remove (K) : basic operation.
            size () : size.
        StringBuilder :
            Mutable string.
            StringBuilder (string) : generates a builder.
            append (int, string, ...) / insert (int offset, ...) : adds objects.
            charAt (int) / setCharAt (int, char) : accesses a char.
            delete (int, int) : removes a substring.
            reverse () : reverses itself.
            length () : returns the length.
            toString () : converts to string.
        String :
            Immutable string.
            String.format (String, ...) : formats a string. i.e. sprintf.
            toLowerCase / toUpperCase () : changes the case of letters.

/* Examples on Comparator :
public class Main {
    public static class Point {
        public int x;
        public int y;
        public Point () {

/*    Another way to implement is to use Comparable.
    However, equalTo and hashCode must be rewritten.
    Otherwise, containers may fail.
    Example :
    public static class Point implements Comparable <Point> {

        public int y;
        public Point () {
            x = 0;
            y = 0;
        }
        public Point (int xx, int yy) {
            x = xx;
            y = yy;
        }
```

```
        public int compareTo (Point p) {
            if (x < p.x) return -1;
            if (x == p.x) {
                if (y < p.y) return -1;
                if (y == p.y) return 0;
            }
            return 1;
        }
        public boolean equalTo (Point p) {
            return (x == p.x && y == p.y);
        }
        public int hashCode () {
            return x + y;
        }
    };
*/
